Plant Parasitic Nematodes : USDA ARS

Nematodes that feed on plant parts are called plant parasitic nematodes (PPN) and are ubiquitous in agricultural soils. The life cycle of a nematode includes eggs, juveniles and adults, and they can overwinter at any of these stages.

Plant Parasitic Nematodes Explained

Plant-parasitic nematodes occur in all sizes and shapes. The typical nematode shape is a long and slender worm-like animal, but often the adult animals are swollen and no longer even resemble worms (Figure 2). Plant-parasitic nematodes range from 250 μm to 12 mm in length, averaging 1 mm, to about 15-35 μm in width.

Nematodes that are parasitic to the plants in a garden tend to be very small and can often only be seen with a microscope. The shape of a plant-parasitic nematode's mouth, or stylet, is like a hypodermic needle that they use to puncture a plant's cells, injecting their own digestive juices and draining the plant fluids into their mouths.
