P. S. HOPE and M. J. FOLKES Mixing two or more polymers together to produce blends or alloys is a well-established strategy for achieving a specified portfolio of physical proper ties, without the need to synthesise specialised polymer systems. The subject is vast and has been the focus of much work, both theoretical and experimental.

Polymer Blends and Alloys. Medical compounds require precision feeding, melting and dispersion of polymers and additives to achieve a homogeneous blend. At Foster, all medical compounding is performed on twin screw extruders with processing capabilities suitable for a wide range of base polymers. Often times in compounding, polymer formulations may require the blending of two commercially available materials to achieve hybrid properties not available from any single resin.

Mixing two or more polymers together to produce a blend (or 'alloy') is one well-established strategy for achieving a specified portfolio of physical properties, without the need to synthesize specialized polymer systems. The subject is vast and has been the focus of much work, both theoretical and experimental.

### **Polymer blends and alloys (Book, 1993) [WorldCat.org]**

8.5.3 Polymer blends. Polymer 'alloys' are generally named polymer blends within the polymer community. In a recent overview of such blends, Robeson (1994) points out that "the primary reason for the surge of academic and industrial interest in polymer blends is directly related to their

potential for meeting end-use requirements". He points out that, in general, miscible polymer pairs confer better properties, mechanical ones in particular, than do phase-separated pairs.
