Vector Control of an Induction motor – The sole idea behind the vector control of induction motor is to have an electrical drive which must offer superior performance than widely used separately excited dc motor in industry. Further such a drive should also emerge as a robust, reliable, maintenance free and cheaper alternative of dc drive.

In case of induction motor vector control, the d-axis is aligned along the rotor flux axis, which implies, $\lambda_{rq} = 0$. For the motor under consideration, squirrel cage induction motor where the rotor bars are shorted, the rotor voltage v_{sd} and v_{sq} are both zero.
